GP1UE26RK0VF/GP1UE27RK0VF Series

Low Voltage Operation, Anti Electromagnetic induction Noise Type, Compact IR Detecting Unit for Remote Control

**Features**

1. Low operating voltage: 2.7 to 5.5V
2. Low dissipation current: MAX. 0.4mA (at Vcc=3V)
3. Anti electromagnetic induction noise type.
5. Various B.P.F. (Band-Pass Filter) frequency to meet different user needs.
6. RoHS directive compliant.

**Applications**

1. AV equipments
2. Home appliances

Performance

Using the transmitter shown in Fig. 1, the output signal of the light detecting unit is good enough to meet the following items in the standard optical system in Fig. 2.

1. Linear reception distance characteristics
   When L=0.2 to 8.0m, \( E_V < 10\text{ lx} \) and \( \phi = 0\text{°} \) in Fig.2, the output signal shall meet the electrical characteristics in the attached list.

2. Sensitivity angle reception distance characteristics
   When L=0.2 to 6.0m, \( E_V < 10\text{ lx} \) and \( \phi \leq 30\text{°} \) in Fig.2, the output signal shall meet the electrical characteristics in the attached list.

3. Anti outer peripheral light reception distance characteristics
   When L=0.2 to 4.0m, \( E_V \leq 300\text{ lx} \) and \( \phi = 0\text{°} \) in Fig.2, the output signal shall meet the electrical characteristics in the attached list.

* It refers to detector face illuminance
*5 Outer peripheral light source: CIE standard light source A shall be used and placed at 45° from perpendicular axis at the detector face center.

![Fig.1 Transmitter](image)

In the above figure, the transmitter should be set so that the output \( V_{OUT} \) can be 40mV. However, the PD49PI to be used here should be of the short-circuit current \( I_{SC} = 2.6\mu\text{A} \) at \( E_V = 100\text{ lx} \).

\( E_V \) is an illuminance by CIE standard light source A (tungsten lamp).

![Fig.2 Standard Optical System](image)

( \( \phi \) indicates horizontal and vertical directions.)
1. When this infrared remote control detecting unit shall be adopted for wireless remote control, please use the following signal format. (NEC code, RC-6code etc.)
   • Total duty ratio \( D_t = \frac{\sum_{i=1}^{n} t_i}{T} \times 100 \) (%)
   • Supply Voltage: \( V_{cc} \) = 2.7 to 3.0V
      | Supply Voltage | \( V_{cc} \) | 2.7 to 3.0V | 3.0 to 5.5V |
      |----------------|--------|-------------|-------------|
      | ON signal time per 1bit | \( t_{ON} \) | 200 \( \mu \)s or more |
      | OFF signal time per 1bit | \( t_{OFF} \) | 400 \( \mu \)s or more |

   \( D_t = \frac{\sum_{i=1}^{n} t_i}{T} \times 100 \) (%)

2. Use the light emitting unit (remote control transmitter), in consideration of performance, characteristics, operating conditions of light emitting device and the characteristics of the light detecting unit.

3. Pay attention to a malfunction of the light detecting unit when the surface is stained with dust and refuse.
   Care must be taken to touch the light detector surface.
   If it should be dirty, wipe off such dust and refuse with soft cloth so as to prevent scratch. In case some solvents are required, use methyl alcohol, ethyl alcohol or isopropyl alcohol only.
   Also, protect the light detecting unit against flux and others, since their deposition on the unit inside causes reduction of the function, fading of markings such as the part number.

4. The shield case should be grounded on PCB pattern.
   (The area across the shield case and the GND terminal is internally non-conductive.)

5. Do not apply unnecessary force to the terminal and the case.

6. Do not push the light detector surface (photodiode) from outside.

7. To avoid the electrostatic breakdown of IC, handle the unit under the condition of grounding with human body, soldering iron, etc.

8. Do not use hole and groove set in the case of the light detecting unit for other purposes, since they are required to maintain the specified performance.

9. External Circuit Examples (Mount the outer parts as near as possible).

\[ R_1 = 47 \Omega \pm 5\% \]
\[ C_1 = 47 \mu F \]

In setting \( R_1 \) and \( C_1 \), use suitable values after considering under the real condition.

This device has a transistor as a protection element between \( V_{cc} \) and GND to improve anti-static electricity proof.

Please be carefully not to apply exceeding the absolute maximum ratings of applying voltage and continuous high voltage spike noise because there is cases that transistor will be short by secondary breakdown generally. In order to do difficultly, Please add CR filter(47 \( \Omega \) (1/10W), 10 \( \mu F \) or more) such as external circuit example above near \( V_{cc} \).
10. There is a possibility that noise on output may be caused by environmental condition (Disturbing light noise, Electromagnetic noise, Power supply line noise, etc.) even if there is no input transmission signal.

11. Please shall confirm operation or your actual machine. Because the output pulse width of this product is fluctuated by environmental conditions such as signal format, temperature, distance from transmitter, and so on.

12. In case that this product is kept in high humidity condition, it may be hard to solder, please be careful enough about storage method.
   Depend on the flux you select, there are different solderabilities, so please select a suitable flux and use it.

13. This product does not correspond to soldering by reflow.

14. Please use this device away from the dew drop.
   Be aware that the dew drop rusts shield case and others, may affect the electric characteristics.
